VOICE GENERATOR BOARD

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

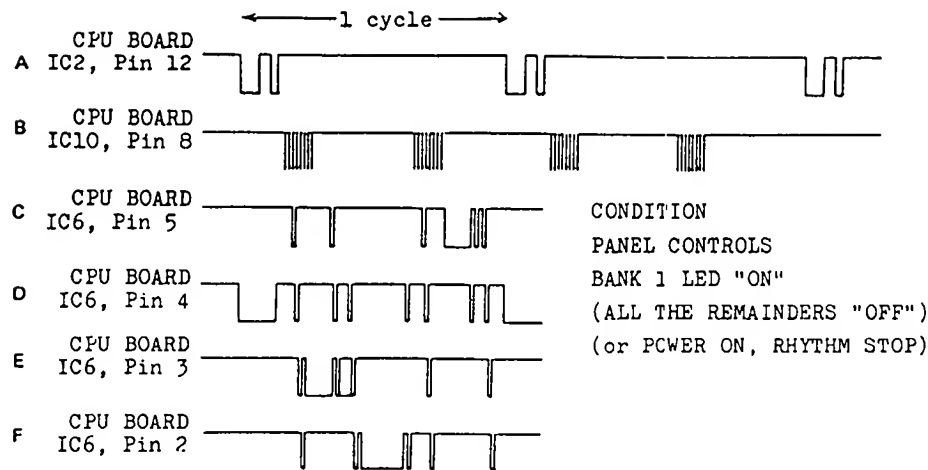

Fig. 2

CIRCUIT DESCRIPTION

SWITCH SCANNING

CPU holds one of switch matrix rows low through LATCH IC1 and DECODER IC6.

Exp. When S11 closes while pin 4 of IC6 (B in Fig. 1) is held low, pin 14 of BUFFER IC1 (A in Fig. 1) which is pulled up via R1, becomes low. This low is read by CPU through data bus.

CPU continues this sequence for the remaining 7 matrix rows (B, Fig. 2).

Once rhythm starts, time interval between switch scanning varies to Tempo Clock rate.

LED DINAMIC SCANNING

To light LED that is on, CPU selects matrix row and column where the LED is connected diagonally.

In the above example D11 has been on, CPU fires LED driver Q1 through LATCH IC2 in sympathy with low at B in Fig. 1 (A and D in Fig. 2.)

Lengths of lows and intervals between lows in Fig. 2 also vary greatly with controls setting and rhythm tempo.

VOICE TRIGGER SIGNAL

CPU delivers trigger signals (negative going) to individual VOICE Generators.

Trigger signal goes negative at the falling edge of tempo clock and stays low until the next falling edge of the tempo clock. That is, width of trigger signal is equal to period of one clock signal. The maximum trigger signal rate is $\frac{24 \text{ clocks}}{4}$ (A).

EXT TRIGGER Derived from LATCH IC1 on CPU board. They are also negative going and the pulse width is equal to that of tempo clock.

RESTART

CPU reads INT terminal (not in use for interrupt application) every 3ms and, when INT is high, resets internal counter to revert to onset of a measure.

If monostable (1/6IC6, C47 and R59) output is high for a period shorter than 3ms or

CE GENERATORS

Most voice generators are designed based on a fashion similar to those detailed in the circuit description of the TR-808 Service Notes which is expected to be referenced to as necessary. Exceptions are Cymbal and Shot. Below are brief comments on individual voices.

The circuit consists of two bridged-T networks.

IC10 has two bridged-T filters for drum sound, in addition, noise generator for snare sound.

IC11:

The bridged-T networks in these stages include two diodes in their RC constant loop. The diode changes conducting rate in proportion to sound amplitude passing through the network, changing filter characteristic, and shifts filter response curve (frequency) along the contour. Pink noise is combined with this output to simulate reverberation.

IC. HC

IC10 is based on Bridged-T. HC output is clamped on D31 and D32 to have multiple harmonics to emphasize highs.

IC. CY

The combined square waves from Schmitt triggers are gated at choppers with the contour produced by respective envelope generator outputs.

Using six Schmitt triggers, two are used which are reset by an RS trigger fed through Q37. The first rising edge of two outputs are synchronized to each other to eliminate unsavory sound at the very first of RS note.

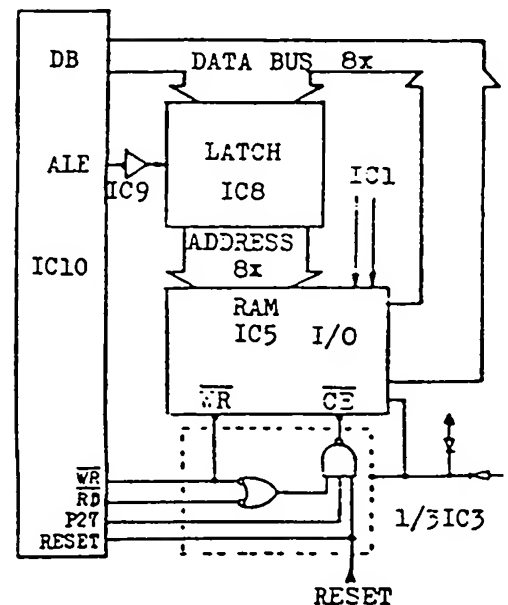

CB

Two oscillator outputs of equal frequency are summed at B1 and gated at choppers.

HCP

HCP sound is accomplished by correlating white noise with square waves derived from IC6.

RAM
CR-8000 only

NOTES:

P27 - high during RAM access
 \overline{CE} - high during power off

ACCENT

outputs of different
summed at BPF after
ers.

Sounds passing through VCA IC7 are
accentuated simaltenously when an
accent pulse is applied to Q41 with
its amplitude determined by VR8
setting.

accomplished by modu-
rise with sawthooth
from IC6.

C (CLAVES)

The circuit is designed based on conventional R-C
phase oscillator.

RAM accessing
power off

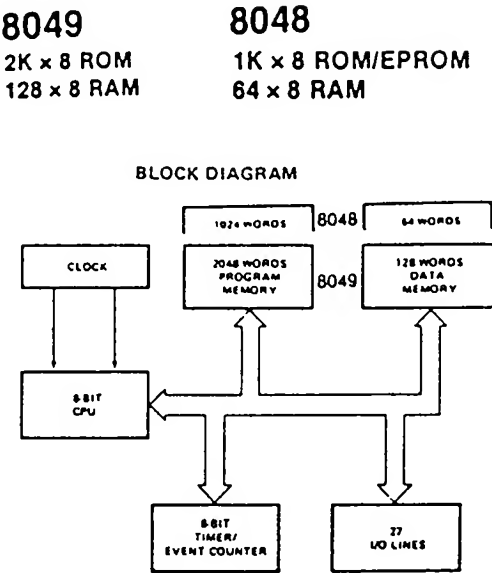

Storage for programmed rhythm patterns are provided
for the CR-8000. The memories are maintained by
backup batteries (three 1.5V dry cells).
The ten address bits are required to access to a
memory location on 1024 words by 4 bit RAM uPD444;
8 bits are latched into IC8 by ALE and 2 bits into
IC1 (also used for switch scanning).

uPD8049C-159

uPD8049C-232 (improved version)

The following program bug is eliminated in the -232 version.

Condition
SHUFFLE ON with alternate rhythm patterns selected.
INTRO/FILL IN is pushed after the termination of first measure pattern.

When INTRO/FILL IN part ends, CPU delivers rhythm pattern data for the first measure but replaces the first step data only with the one for the second measure.

This is perceptive in RHUMBA, BEGUINE or

TEMPO DISPLAY (CR-8000 only)

μ PD8048C IC3 on Control Brd counts

Tempo Clocks derived from Q9 on CPU Brd whenever power is being fed to the CR-8000.

Since 24 tempo clocks are made equal to one J, actual tempo displayed is

$$\frac{\text{clocks per minute}}{24}$$

CPU performs an equivalent eq. in a short period and drives Q18-Q20 on Control Brd in synchronous with drive signals for 7 segments of display LEDs.

Upon rhythm running INT of CPU IC3 goes and stays negative with which CPU's internal count gate is disabled, then re-started at the first falling edge of the next tempo clock. This count break allows CPU to skip transitional tempo clock that is reset by a start signal.

If INT remains high after rhythm running, tempo display varies temporarily.

CATIONS.

ADJUSTMENTS

CPU BOARD

RAM BACK UP BATTERIES (CR-8000 only)

Power switch must be turned OFF.

Connect 100 ohms across pins 18 (Vcc) and 9 (GND) of RAM IC5 or shunt meter (scope or voltmeter) inputs with 100 ohms. Confirm approx. 4V at pin 18.

TEMPO CLOCK

Allow at least 10 minutes for circuit thermal stabilization.

CR-5000

Connect scope to pin 1 of CPU (TP-1). Set scope time base to 5ms/div.

With TEMPO set at 200 adjust VR1 for 12.5ms/cycle (50ms/4 cycles).

Reset TEMPO to 50 and confirm that 1 cycle is 50ms ± 1ms. If exceeds this limit, readjust VR1 for 1ms at the sacrifice of ± 2ms error at TEMPO 200.

CR-8000

Turning TEMPO across its travel, confirm TEMPO DISPLAY; factory set ranges from 33 ± 2 to 375 ± 5%. Adjust VR1 as required.

NOTE: TEMPO = $\frac{2500}{\text{period of one tempo clock cycle (ms)}}$

VOICE BOARD

NOISE

Connect scope (1V/div, time base relatively slow) to TP-3.

Adjust VR11 for 2V p-p when measured at rather dense peaks.

CB

Connect scope to TP-1. Adjust VR12 for 1.25ms/cycle.

Connect scope to TP-2. Adjust VR13 for 1.8ms/cycle.

CY

See table right.

Probing CP1-CP6 of oscillators IC6, confirm frequency ratios between adjacent two; they should be in 1.1-1.4 steps.

Note that two oscillators generating on too close frequency will sound beating cymbal which can be eliminated by tailoring R and C listing on the table.

OFFSET

Controls set up - All VOICE LEVELs: FCCW; VOLUME, ACCENT: MAX; RYTHM: DISCO
Start the rythm. Monitoring through OUTPUT jack (scope or amp), adjust VR4 for minimum thump.

HCP (CR-8000 only)

Controls set up - HCP VOICE LEVEL: FCW; VOLUME: MAX; ARRANGER: HAND CLAP
Connect scope V IN to OUTPUT jack and H (EXT) to HCP trig terminal 23.

Adjust VR10 for the below:

Serial number up to 101299 1V p-p

Serial number 101300 and up 2V p-p

CHANGING OPERATIONAL AMPLIFIERS

On CR-5000/8000 VG Boards as well as in other Roland products, the IC NJM4558S replaces HA1457W which is discontinued at the semiconductor manufacturer.

Incompatible pin arrangement leads to minor PCB re-layout as shown below, which is due to put into practical production.

Serial Numbers with which the change is effective on the CR-5000/8000 are not fixed as of the date this edition is closed.

NOTE: Although two OP AMPs are contained in new IC, one is left redundant in this application.
